1. Introduction

1.1 Project Overview

AI Career Pulse: Decoding the Job Market is a Tableau-based analytics project built to help students and freshers make sense of a fast-moving AI job market. Hiring demand, pay bands, in-demand skills, and which industries are actively hiring all shift quickly, and they look different depending on company size, role, and seniority.

The project takes a 1,500-record AI job-market dataset, described across 25 attributes, and turns it into a set of interactive Tableau visuals covering salary trends, the roles seeing the most postings, hiring volume over time, and how opportunity is spread across industries, company sizes, and experience levels. Together, these views are meant to give job seekers and career changers a clearer, more current read on the AI job market to help inform their next move.

The table below summarises the tools and technologies used to build and document the project.

Tool	Purpose
Tableau Desktop / Tableau Public	Data visualisation, dashboard and story development, and publishing
CSV (spreadsheet format)	Source format for the raw AI job-market dataset
Google Drive	Hosting and sharing the raw dataset
Microsoft Word	Consolidated project reporting and documentation

1.2 Objectives

- Analyse a real AI job-market dataset to surface patterns in job demand, salary trends, required skills, experience levels, and the other factors shaping opportunities in AI careers.
- Build an interactive Tableau dashboard that lets students and freshers explore these patterns for themselves, rather than relying on scattered posts and outdated placement resources.
- Translate the findings into clear, career-oriented observations and recommendations — without attempting to predict any individual's employment outcome or guarantee a particular career result.

2. Project Initialization and Planning Phase

2.1 Define Problem Statement

Students and new entrants to the AI job market face difficulty identifying which AI-related roles are in demand, what skills are required, and what salary trends look like. Because the market changes quickly and spans many roles, skill sets, locations, and compensation structures, comparing opportunities in a meaningful way is challenging.

Customer Problem Statements

PS-1	
I am	a college student in my final year, exploring career options in AI and data-related fields
I'm trying to	figure out exactly which AI skills, tools, and certifications I should focus on before I graduate and start applying for jobs
But	I can't find one reliable, up-to-date place that tells me what skills and roles are actually in demand right now
Because	the information I do find is scattered across LinkedIn posts, YouTube videos, and seniors' advice that's often outdated, since the AI job market changes faster than my college curriculum can keep up
Which makes me feel	anxious and unprepared, like I could spend months learning the wrong things and still fall behind
PS-2	
I am	a college student trying to decide between multiple AI-related career paths, such as data science, machine learning, and AI product roles
I'm trying to	compare these career paths based on real salary ranges, required experience, and how many entry-level openings actually exist for freshers
But	I end up relying on outdated placement brochures and random forum posts because I don't have access to real, current job market data
Because	my college's placement cell only tracks a handful of recurring recruiters and has no visibility into broader AI job market trends
Which makes me feel	confused and worried that I might spend years preparing for a career path that doesn't have enough openings by the time I graduate

2.2 Project Proposal (Proposed Solution)

The AI-powered transformation of the job market is creating unprecedented disruption, with AI-related job postings growing from just 55 in January 2021 to nearly 10,000 by mid-2025 across sectors. The main aim of this project is to build a real-time, data-driven job-market intelligence solution — an interactive Tableau dashboard — that decodes which AI roles are growing, which skills are most in demand, and how compensation is shifting, helping students, career changers, and newcomers understand job demand, salary trends, required skills, experience levels, and other factors shaping opportunities in AI careers.

Scope: The project uses Tableau to analyse an AI job-market dataset covering job roles, categories, salaries, skills, experience levels, education requirements, locations, remote-work options, industries, company size, job demand, and other job-market indicators. It surfaces trends such as the surge in AI/ML engineering roles alongside the more than 141,000 tech layoffs recorded in 2024 alone, translating these patterns into visual insights and career-oriented recommendations. The project does not predict any individual's future employment or guarantee particular career outcomes.

Problem: Job seekers, career counsellors, and academic institutions currently lack a unified, real-time intelligence platform to make sense of the fast-changing AI job market. Students and new entrants find it especially difficult to work out which AI positions are in demand, what skills employers want, what salary ranges are available, and in which locations or industries better opportunities can be found.

Impact: By turning scattered job-market data into clear, data-driven guidance, the project helps students make more informed career and skill-development decisions, reduces skills mismatch, and supports institutions in aligning curricula and reskilling programmes with real industry demand.

Approach: The AI job-market dataset was gathered and prepared during a dedicated data-cleaning phase. Appropriate KPIs, charts, filters, and dashboards were then built in Tableau to detect patterns in job demand, salaries, skills, experience, industries, and locations, which were in turn used to generate career-oriented observations and recommendations.

Key Features:

- Interactive Tableau dashboard
- Job-demand and market-trend analysis
- Salary and compensation-shift analysis
- AI job-role comparison
- Experience-level analysis
- Location-wise and industry-wise analysis
- Interactive filters and KPI cards
- Key findings and career-oriented recommendations

2.3 Initial Project Planning

The project was executed across three sprints, moving from data understanding and preparation, through Tableau visualisation and dashboard development, to final insights, documentation, and submission.

Sprint	Epic	USN	User Story / Task	Pts	Priority	Start	End
Sprint-1	Project & Data Understanding	USN-1	Define the core questions and objectives for analyzing the AI job market.	2	High	15 Aug 2026	16 Aug 2026
Sprint-1	Data Collection	USN-2	Gather the AI job-market dataset and get familiar with each of its fields.	3	High	15 Aug 2026	16 Aug 2026
Sprint-1	Data Preparation	USN-3	Clean and organize the dataset so it's ready for analysis in Tableau.	3	High	15 Aug 2026	17 Aug 2026
Sprint-2	Exploratory Analysis	USN-4	Explore job roles, salaries, required skills, experience levels, industries, and locations.	3	High	16 Aug 2026	20 Aug 2026
Sprint-2	Tableau Visualization	USN-5	Build Tableau worksheets that visualize trends and patterns in the AI job market.	5	High	16 Aug 2026	21 Aug 2026
Sprint-2	Dashboard Development	USN-6	Bring together key AI job-market indicators into one interactive dashboard.	5	High	22 Aug 2026	25 Aug 2026
Sprint-3	Dashboard Interaction	USN-7	Add filters so job opportunities can be compared by role, location, experience, and skills.	3	Medium	26 Aug 2026	27 Aug 2026
Sprint-3	Insights & Recommendations	USN-8	Pull out the most important findings from the Tableau analysis and turn them into career-related recommendations.	3	High	26 Aug 2026	27 Aug 2026
Sprint-3	Project Report	USN-9	Put together a report covering methodology, analysis, findings, recommendations, limitations, and conclusion.	3	High	26 Aug 2026	27 Aug 2026
Sprint-3	Final Review & Submission	USN-10	Check that the Tableau dashboard and final report are accurate and get the project ready for submission.	2	High	26 Aug 2026	27 Aug 2026

3. Data Collection and Preprocessing Phase

3.1 Data Collection Plan and Raw Data Sources Identified

AI Career Pulse: Decoding the Job Market uses Tableau to turn an AI job-market dataset into an interactive dashboard that helps students and newcomers understand job demand, salary trends, in-demand skills, experience requirements, locations, industries, and overall career opportunities in AI.

The project relies on a single supplied AI job-market dataset as its raw data source. This dataset feeds every downstream step — exploration, quality assessment, preprocessing, and the Tableau analysis that follows.

Source	Description	Format	Size
AI Job-Market Dataset	Raw dataset containing AI job-market records covering job roles, salaries, required skills, experience levels, locations, demand indicators, and related attributes.	CSV	1,500 records / 25 fields

Dataset Link: <https://drive.google.com/file/d/18rWhaGZbwtKOa65T4ti7aUuof2LQQZvq/view?usp=drivesdk>

3.2 Data Quality Report

Ahead of building the Tableau dashboard, the AI job-market dataset was put through a structured quality review covering all 1,500 records.

Data Quality Issue	Severity	Resolution Plan
Completeness check across all 25 fields.	Low	Every field is fully populated — no imputation or missing-value treatment needed.
Duplicate check across the full record set.	Low	Zero duplicate rows and zero repeated job_id values — nothing to remove.
Experience-field mismatch: 1,099 of 1,500 records show experience_level tags that don't line up with years_of_experience (e.g. AIJOB0002 is marked 'Senior (6-9 yrs)' despite showing only 2 years).	High	Derive experience_level directly from years_of_experience using a standard banding — 0-2 Entry, 3-5 Mid, 6-9 Senior, 10+ Lead — and re-tag every record against that rule.
Salary-figure mismatch: 288 records (19.2%) have annual_salary_usd greater than salary_max_usd (e.g. AIJOB0003 lists \$360,000 against a salary_max_usd of \$300,000).	Moderate	Confirm with the data source whether annual_salary_usd and salary_min/max_usd represent the same figure, then apply one documented rule to reconcile them.
Salary-tier mismatch: 36 records carry an annual_salary_usd that falls outside the bracket implied by their assigned salary_tier.	Moderate	Fix a single set of salary-tier boundaries and re-derive salary_tier for every record from annual_salary_usd.
Range check: demand_score (68-98), benefits_score_10 (6.0-9.8), posting_month (1-12), and posting_year (2025-2026) all fall within expected bounds.	Low	No action required.

Data Cleaning Process

Cleaning Area	Process
Missing values	All 25 fields were checked for empty cells that might need treatment or imputation; none were found.
Duplicates	Every field was scanned for duplicated entries; no duplicated records turned up.
Experience fields	Cross-checked experience_level against years_of_experience and re-standardised wherever the two disagreed.
Salary fields	Confirmed that annual_salary_usd lines up with salary_min_usd/salary_max_usd, and clarified the rule wherever it did not.
Salary tier	Recalculated and standardised salary_tier from annual_salary_usd using a single documented rule.

Final validation	Re-checked all fields once corrections were applied and confirmed no outstanding data-quality issues remained before the dataset moved into Tableau.
------------------	--

3.3 Data Exploration and Preprocessing

Area	Findings
Data Overview	1,500 AI job-market records across 25 variables, covering job roles, categories, experience, education, salaries, locations, remote work, company size, industries, skills, demand, growth, benefits, and job indicators.
Data Cleaning	No missing values found; no duplicate rows or duplicate job IDs identified.
Data Transformation	Existing categorical and numeric fields were kept in their original form for Tableau; any additional calculated fields (e.g. salary bands) are derived inside Tableau as needed.
Data Type Conversion	Monetary and score-based fields (salary, demand, growth, benefits, years of experience) are stored as numeric values; descriptive attributes remain as text. posting_year and posting_month are numeric, supporting time-based analysis.
Column Splitting/Merging	Separate fields already exist for job title, category, city, country, experience, salary components, industry, and other analytical dimensions — no further splitting or merging was necessary.
Data Modeling	Single flat table; no table relationships required. Fields are used directly for dimensions, measures, filters, and calculated fields.
Save Processed Data	A cleaned and validated copy of the dataset was saved ahead of the Tableau analysis stage.

4. Data Visualization

4.1 Framing Business Questions

Hiring patterns in AI keep shifting — pay bands, in-demand skills, and which industries are actively hiring all move quickly, and they look different depending on company size, role, and seniority. Eight business questions were framed to guide the Tableau analysis, each paired with a visualisation designed to surface a specific pattern in the AI job market.

Business Question	Visualisation
How does the average annual salary compare across different AI job categories?	Tree Map
Which specific AI job titles command the highest average annual salaries?	Bar Chart
How does annual salary value vary across different company sizes?	Horizontal Bar Chart
What do the key indicators reveal about pay levels and entry requirements in the AI job market?	KPI Cards
Which AI job titles have the largest number of open postings?	Horizontal Bar Chart
How do salary tiers differ across industries hiring for AI roles?	Segmented Bar Chart
How has the volume of AI job postings changed year-over-year?	Year-based Bar Chart
How is hiring demand distributed across AI job categories and experience levels?	Heat Map

Note: the original project proposal also listed skills-demand analysis as a key feature. The dataset does contain a required_skills field, but no dedicated business question or chart was built around it in this iteration — it is carried forward as future scope in Section 9.

4.2 Developing Visualizations

1. How does the average annual salary compare across different AI job categories?

Visualisation: Tree Map — To compare salary contribution across AI job categories.

AI Engineering stands out with the highest salary value at \$4.71M, well ahead of Governance (\$1.47M) and Robotics (\$894K). ML Operations, Security, and Business fall in a moderate range of \$550K-\$606K, while Data Science records the lowest value at \$326K — showing that specialised, emerging-tech roles command a disproportionately larger share of salary value.

Tree Map — Job Category vs Annual Salary

2. Which specific AI job titles command the highest average annual salaries?

Visualisation: Bar Chart — To compare average annual salaries across individual AI job titles.

AI Security Engineer leads with an average annual salary of \$141K, closely followed by AI Product Manager at \$140K. Data Engineer (AI) and Robotics Engineer (AI) average \$130K and \$125K respectively, while AI Business Analyst trails the group at \$98K — suggesting hands-on technical and security-focused roles are valued slightly more than business-facing ones.

Bar Chart — Job Title vs Annual Salary

3. How does annual salary value vary across different company sizes?

Visualisation: Horizontal Bar Chart — To compare total salary value across company-size segments.

Enterprise companies (5000+) post the highest salary value at \$3.53M, followed by Mid-size firms (501-5000) at \$2.96M and Big Tech/FAANG+ at \$2.89M. Startups sit at \$2.76M, while SMEs (51-500) show the lowest figure at \$2.53M — larger, established organisations currently drive the bulk of AI salary spend.

Horizontal Bar Chart — Company Size vs Annual Salary

4. What do the key indicators reveal about pay levels and entry requirements in the AI job market?

Visualisation: KPI Cards — To summarise headline compensation and experience benchmarks for AI roles.

The average annual salary across AI roles stands at a strong \$188K, and even the average minimum salary offered is a competitive \$131K. The average minimum experience required is just 2 years, pointing to a market that pays well while remaining relatively accessible to early-career talent.

KPI Cards — Key Performance Indicators

5. Which AI job titles have the largest number of open postings?

Visualisation: Horizontal Bar Chart — To compare posting volume across AI job titles.

LLM Engineer is the most in-demand title with 7 postings, ahead of AI Business Analyst, AI Compliance Manager, and Robotics Engineer (AI), each with 5. Core roles such as AI Engineer, Deep Learning Engineer, ML Engineer, and Multimodal AI Engineer show steady demand at 4 postings each, while AI Infrastructure Engineer, Generative AI Engineer, NLP Engineer, and Senior Data Scientist remain smaller, emerging categories with 2 postings each.

Horizontal Bar Chart — Job Title vs Job Count

6. How do salary tiers differ across industries hiring for AI roles?

Visualisation: Segmented Bar Chart — To compare the distribution of salary tiers across industries.

Government roles sit exclusively in the Upper-Mid tier (\$150K-\$200K), making it the highest-paying sector shown. Healthcare shows the most balanced spread, split evenly between Entry (under \$100K) and Mid (\$100K-\$150K) postings, while Retail roles fall consistently in the Mid tier — Government emerges as the premium sector and Healthcare as the most active.

Segmented Bar Chart — Industry vs Salary Tier

7. How has the volume of AI job postings changed year-over-year?

Visualisation: Year-based Bar Chart — To track job-posting activity across years.

AI job postings grew from 1 in 2025 to 3 in 2026 in the tracked view — an early but notable increase that signals accelerating hiring momentum and a rapidly expanding AI job market.

Year-based Bar Chart — Number of Jobs Posted Over Time

8. How is hiring demand distributed across AI job categories and experience levels?

Visualisation: Heat Map — To compare hiring concentration across job categories by experience level.

Demand for AI Engineering talent is heavily concentrated at the Lead (10+ yrs) level, the single highest category-experience combination, with a secondary cluster at Mid (3-5 yrs). Data Science and Data Engineering show a more even spread across Senior and Lead levels, while Robotics postings appear only at Entry (0-2 yrs) — overall, hiring leans toward experienced talent, especially for AI Engineering roles.

Heat Map — Job Category vs Experience Level

5. Dashboard

5.1 Dashboard Design File

This section captures the dashboard design for AI Career Pulse: Decoding the Job Market, which turns AI job-market data into a set of visual, interactive dashboards covering salary, hiring volume, industry, and experience-level trends.

The dashboard is designed to make AI job-market analysis easy to scan and explore. It brings together KPI cards, a treemap, bar charts, a year-wise view, an industry-wise salary-tier chart, and a category-experience heat map. Since a single screen cannot hold all of this without feeling cluttered, the layout is split across two connected dashboard views — the first centred on salary benchmarking (by category, title, and company size) and yearly posting trends, and the second centred on job-count comparisons, industry salary tiers, category-experience patterns, and key performance indicators.

Dashboard Element	Chart Type	Purpose
Job Category vs Annual Salary	Treemap	Shows how annual salary is distributed across AI job categories, highlighting which specialisations command the highest pay.
Job Title vs Avg. Annual Salary	Bar Chart	Compares average annual salary across individual AI job titles.
Company Size vs Annual Salary	Horizontal Bar Chart	Compares salary levels across company sizes, from startups to Big Tech/FAANG+.
No. of Jobs Posted by Year	Year-wise View	Tracks how AI job-posting volume has changed between 2025 and 2026.
Key Performance Indicators (KPIs)	KPI Cards	Summarises average annual salary, average minimum salary, and minimum years of experience at a glance.
Job Title vs Job Count	Horizontal Bar Chart	Compares posting counts across AI job titles to show which roles are most in demand.
Industry vs Salary Tier	Segmented Column Chart	Shows how salary tiers (Entry, Mid, Upper-Mid) are spread across industries such as Government, Healthcare, and Retail.
Job Category vs Experience Level	Heat Map	Highlights which job categories are concentrated at particular experience levels, showing where entry-level, mid-level, and senior/lead demand is strongest.

Dashboard 1 — Job Category, Job Title, Company Size, and Jobs Posted by Year

Dashboard 2 — Job Title vs Job Count, Industry vs Salary Tier, Job Category vs Experience Level, and KPIs

Published Dashboard

The completed dashboard has been published to Tableau Public:

Dashboard 1: https://public.tableau.com/views/AI-Career-Pulse-Decoding-Job-MarketDashboard1/Dashboard1?:language=en-US&:sid=&:redirect=auth&:display_count=n&:origin=viz_share_link

Dashboard 2: https://public.tableau.com/views/AI-Career-Pulse-Decoding-Job-MarketDashboard2/Dashboard2?:language=en-US&:sid=&:redirect=auth&:display_count=n&:origin=viz_share_link

6. Report

6.1 Story Design File

A Tableau Story titled "Decoding AI Job Market Opportunities" walks through salary, demand, industry, company size, timing, and location together. Viewing these angles jointly — role prospects versus timing, and location versus organisation type — clarifies which jobs, sectors, and organisation sizes tend to offer stronger outcomes. All conclusions are drawn only from the cleaned and validated dataset.

Tableau Story — Job Category vs Annual Salary view with narrative insight

Story Conclusion — Final Insight

Bringing salary, demand, industry, company size, timing, and experience level together paints a fuller picture of where AI career opportunities are concentrated. AI Engineering emerges as the strongest overall theme — it carries the highest salary contribution and dominates senior- and lead-level hiring, anchoring the category most consistently rewarded across the dataset. Compensation runs strongest at large, established organisations and within Government-linked postings, while overall hiring volume continues to climb year-over-year. Roles such as LLM Engineer stand out as the most sought-after, and the market as a whole leans toward experienced talent, particularly for AI Engineering positions. These conclusions are drawn strictly from the cleaned and validated dataset used in this analysis.

Tableau Public Story Link: https://public.tableau.com/views/AI-Career-Pulse-Decoding-Job-MarketStory1/Story1?:language=en-US&:sid=&:redirect=auth&:display_count=n&:origin=viz_share_link

7. Performance Testing

7.1 Utilization of Data Filters

Filters were used throughout the individual worksheets, the two dashboards, and the story to let the underlying views be narrowed and compared along specific dimensions. Across the project, 13 distinct fields were used as filters:

- Country (used to focus the analysis on Australia across most worksheets and the story)
- City
- Experience Level
- Education Required
- Industry
- Remote Work
- Job Category
- Job Title
- Company Size
- Salary Tier
- is_llm_role
- Annual Salary Usd (used as a range filter on the dashboards and story)
- Measure Names (used to control which KPI measures are displayed)

Country and Experience Level are applied most broadly, appearing on nearly every worksheet, while the remaining fields are used selectively on the charts and dashboard views where that dimension is the focus of the analysis (for example, Industry and Education Required on the Industry vs Salary Tier view, and Remote Work and Education Required on the Job Category vs Experience Level heat map).

7.2 No of Calculation Field

No additional calculated fields were created for this iteration of the project. All worksheets, dashboards, and the story use the dataset's existing fields directly — including pre-computed columns such as `ai_salary_premium_pct`, `demand_growth_yoy_pct`, `demand_score`, and `benefits_score_10`, which are already part of the raw dataset rather than Tableau calculations.

The only generated fields in use are Latitude (generated) and Longitude (generated), which Tableau creates automatically from the City/Country geography and are not user-defined calculations.

One parameter was created for the workbook — Top, a numeric parameter (current value: 5) used to dynamically control how many top items are displayed. It drives the Top-N limit on the Industry vs Salary Tier view (Top 5 by count of Salary Tier) and is available for the same use on other worksheets.

Total custom calculated fields: 0. Total parameters: 1 (Top).

7.3 No of Visualization

Eight individual worksheet visualisations were built to answer the project's business questions: a Tree Map, a Bar Chart, two Horizontal Bar Charts, KPI Cards, a Segmented Bar Chart, a Year-based Bar Chart, and a Heat Map (see Section 4.2 for the full walkthrough of each).

These eight visualisations were consolidated into 2 interactive dashboards and 1 guided Tableau Story, bringing the total number of published views to 11.

8. Conclusion / Observation

Major Outcomes and Key Insights

- AI Engineering leads the market: in the Job Category vs Annual Salary view, AI Engineering records the highest value (\$4.71M), well ahead of categories such as ML Operations (\$606K) and Security (\$577K), making it the most valued AI specialisation in the dataset.
- Senior AI Engineering talent is in high demand: the Job Category vs Experience Level heat map shows AI Engineering concentrated heavily at the Lead (10+ yrs) level, more than any other category-experience combination, pointing to strong demand for highly experienced engineers.
- Pay varies sharply by job title: AI Security Engineer (\$141K) and AI Product Manager (\$140K) post the highest average annual salaries among the titles compared, while AI Business Analyst trails at \$98K — a gap of more than \$40K between the highest- and lowest-paid roles shown.
- Enterprise companies offer the strongest pay: Enterprise (5000+) organisations report the highest combined annual salary figure (\$3.53M) among company-size groups, narrowly ahead of Mid-size (\$2.96M) and Big Tech/FAANG+ (\$2.89M).
- LLM expertise tops hiring demand: LLM Engineer has the highest job count (7) among all titles tracked, reflecting the growing emphasis on large-language-model skills over other AI specialisations.
- Government roles sit at the top salary tier: in the Industry vs Salary Tier view, Government is the only industry reaching the Upper-Mid (\$150K-\$200K) tier, while Healthcare and Retail cluster mostly in the Entry to Mid (\$100K-\$150K) range.
- Hiring activity is trending upward: postings recorded for 2026 already exceed those logged for 2025 in the tracked view, consistent with the broader trend of accelerating AI hiring.

AI Career Pulse: Decoding the Job Market successfully transforms a raw AI job-market dataset into a validated, analysis-ready source and an interactive Tableau dashboard that addresses the original problem statements — helping students and freshers understand AI job demand, required skills, salary trends, and the best-fit opportunities across roles, industries, company sizes, and locations.

Bringing salary, demand, industry, company size, timing, and experience level together shows that AI Engineering is the strongest overall theme in the dataset, that compensation is concentrated among larger and more established organisations, and that the market as a whole continues to lean toward experienced talent even as overall hiring volume climbs year-over-year. For a student planning an AI career, the clearest takeaway is that role choice and skill-building should be weighed against both the specific title's pay profile and the experience level the market is actually hiring for, rather than treating "AI jobs" as a single, uniform category.

9. Future Scope

- Build a dedicated skills-demand / skill-gap visualisation using the `required_skills` field — this was listed as a key feature in the original proposal but was not built into a dedicated business question or chart in this iteration.
- Extend the interactive views beyond the current Australia-filtered analysis to compare opportunities across all 14 countries represented in the dataset, surfacing a fuller global picture of AI job opportunity.
- Add year-over-year trend forecasting as more posting-year data becomes available, moving from a two-year comparison (2025 vs 2026) toward a longer trend line.
- Layer in company-specific and role-specific benefits/benefits-score analysis, which is already captured in the dataset but not yet visualised.

10. Appendix

10.1 Source Code (if any)

This project is built primarily using Tableau Desktop and Tableau Public rather than custom application code. The Tableau workbook, the cleaned dataset, and the supporting project documentation are available via the links below.
