

Project Initialization and Planning Phase

Date	15 August 2026
Project Title	AI Career Pulse: Decoding the Job Market

Project Proposal (Proposed Solution) template

The project proposal sets out a solution for dealing with a particular problem; it has a well-defined aim, a clearly established scope, and a succinct problem statement, and the proposed solution then describes the method to be used, the main features, and the resource requirements, such as hardware, software, and data resources.

Project Overview

Objective

The AI-powered transformation of the job market is creating unprecedented disruption, with AI-related job postings growing from just 55 in January 2021 to nearly 10,000 by mid-2025 across sectors. The main aim of this project is to build a real-time, data-driven job-market intelligence solution — an interactive Tableau dashboard — that decodes which AI roles are growing, which skills are most in demand, and how compensation is shifting, helping students, career changers, and newcomers understand job demand, salary trends, required skills, experience levels, and other factors shaping opportunities in AI careers.

Scope

The project involves the use of Tableau to analyse an AI job-market dataset covering job roles, job categories, salaries, skills, experience levels, education requirements, locations, remote-work options, industries, company size, job demand, and other job-market indicators. It will surface trends such as the surge in AI/ML engineering roles alongside the more than 141,000 tech layoffs recorded in 2024 alone, and translate these patterns into visual insights and career-oriented recommendations. The project will not be used to predict any individual's future employment or guarantee particular career outcomes.

Problem Statement — Description

Job seekers, career counsellors, and academic institutions currently lack a unified, real-time intelligence platform to make sense of the fast-changing AI job market. Students and new entrants find it especially difficult to work out which AI positions are in demand, what skills employers want, what salary ranges are available, and in which locations or industries better opportunities can be found — a challenge made harder by a labour market that is constantly evolving and spans a great many roles and requirements.

Impact

By turning scattered job-market data into clear, data-driven guidance, the project empowers first-generation job seekers, career changers, and students from underserved backgrounds to make more informed decisions. It helps reduce skills mismatch in the labour market, supports universities in aligning curricula with industry demand, and can help institutions and policymakers design more targeted, evidence-based reskilling programmes.

Approach

The way to proceed is to gather and prepare the AI job-market dataset during a dedicated data-cleaning phase, then build appropriate KPIs, charts, filters, and dashboards in Tableau to detect

patterns in job demand, salaries, skills, experience, industries, and locations. The insights obtained in this way will then be applied to surface meaningful trends — such as shifting compensation and emerging role categories — and to generate useful, career-oriented observations and recommendations.

Key Features

- Interactive Tableau dashboard
- Job-demand and market-trend analysis
- Salary and compensation-shift analysis
- AI job-role comparison
- Skills-demand and skill-gap analysis
- Experience-level analysis
- Location-wise job analysis
- Industry-wise analysis
- Interactive filters
- KPI cards and visual summaries
- Key findings and career-oriented recommendations

Section	Details
Overview	Tableau-based intelligence dashboard decoding AI job-market trends for students and freshers.
Objective	Identify AI job demand, salaries, skills, and career opportunities in real time.
Scope	Roles, salaries, skills, experience, locations, industries, and demand.
Problem	Job seekers and institutions lack a unified platform to compare AI roles, skills, salaries, and opportunities.
Impact	Helps students, career changers, and institutions make informed career and skill-development decisions.
Solution	Analyse job-market data and present it through an interactive Tableau dashboard.
Features	KPIs, filters, job/salary/skill analysis, comparisons, and recommendations.
